Company Admin: Recommended Module Build Order

Which page to build first among Dashboard, Accountant, Staff, Vendor, Customer, Products & Services, Invoices, Bills/Expenses, Payments & Bank, Report & Taxes, Subscription, and Settings — based on how the data depends on each other.

Build order matters because later pages depend on data created in earlier ones. If Invoices is built before Customers exist, there's nothing to select in the dropdown. The table below lists the logical build order with the reasoning for each step.

#	Page	Why this order
1	Settings (Profile info)	Company name, currency, tax rate, invoice number format — every other page (invoices, reports) reads these settings. Build the foundation first.
2	Customer	Needed before Invoices — you can't create a sale without a customer to sell to.
3	Vendor	Needed before Bills/Expenses — you can't record a purchase without knowing who you bought from.
4	Products & Services	Needed before Invoices/Bills — both need a product/service line item to bill against.
5	Invoices	Now Customers + Products are ready, so you can actually create a sale/invoice.
6	Bills/Expenses	Same logic — now Vendors + Products are ready to record purchases.
7	Payments & Bank	Needs Invoices and Bills to already exist, since payments are made against an invoice (money in) or a bill (money out).
8	Accountant & Staff (team roles)	Build once the core modules (Customer/Vendor/Product/Invoice/Bill) exist, so there's something meaningful to assign permissions on.
9	Report & Taxes	Reports pull data FROM invoices, bills, and payments — so this must come after those modules have real data flowing through them.
10	Subscription	About the SaaS plan/billing for the platform itself — least urgent, can be built last since it doesn't block any core accounting logic.
11	Dashboard	Build LAST, even though it's the first page users see. It's just a summary screen pulling numbers from everything above — no real stats until real data exists.

THE SIMPLE RULE TO REMEMBER

“Build in the order data flows, not the order pages appear in the sidebar.”

The Data Flow, Visually

Setup → Who you deal with (Customer/Vendor) → What you sell (Products) → Transactions (Invoices/Bills) → Money movement (Payments) → People/roles (Accountant/Staff) → Summaries (Reports, Dashboard) → Business side (Subscription)

Concretely: start with **Settings** today, then **Customer** right after — those two unblock everything else.

Notes for the MARKGO build: this order also matches a sensible Prisma migration sequence — Company/Settings and User/Role tables first, then Customer and Vendor tables, then Product, then Invoice/Bill (which foreign-key into Customer/Vendor/Product), then Payment (foreign-keys into Invoice/Bill), and finally reporting queries that aggregate across all of them.
